# I. INTRODUCTION

Villas at Orange Lawn, LLC (Applicant - Villas) has proposed the construction of twenty (20), three bedroom townhouse units in ten, 2.5 story buildings, located in the eastern section of the Orange Lawn Tennis Club site (Club), in the Township of South Orange Village, Essex County, New Jersey. The Club site (Block 1304, Lot 6) is situated just west of North Ridgewood Road and between Redwood Road and Forest Road. The townhouse project is to be constructed on a 4.6 acre section of land being sold/subdivided by the Club to the Villas. A total of 80 parking spaces are proposed on the residential site.

Access for the townhouse project will be through a cul-de-saced (hammerhead terminus design) roadway that will intersect the Club's existing access drive that extends to N. Ridgewood Road. As part of the project, some widening of the N. Ridgewood Road access drive will be performed between the vicinity of the townhouse site drive and N. Ridgewood Road. Roadway access is also available for the townhouse residents through another access drive traversing the Club site to Redmond Road.

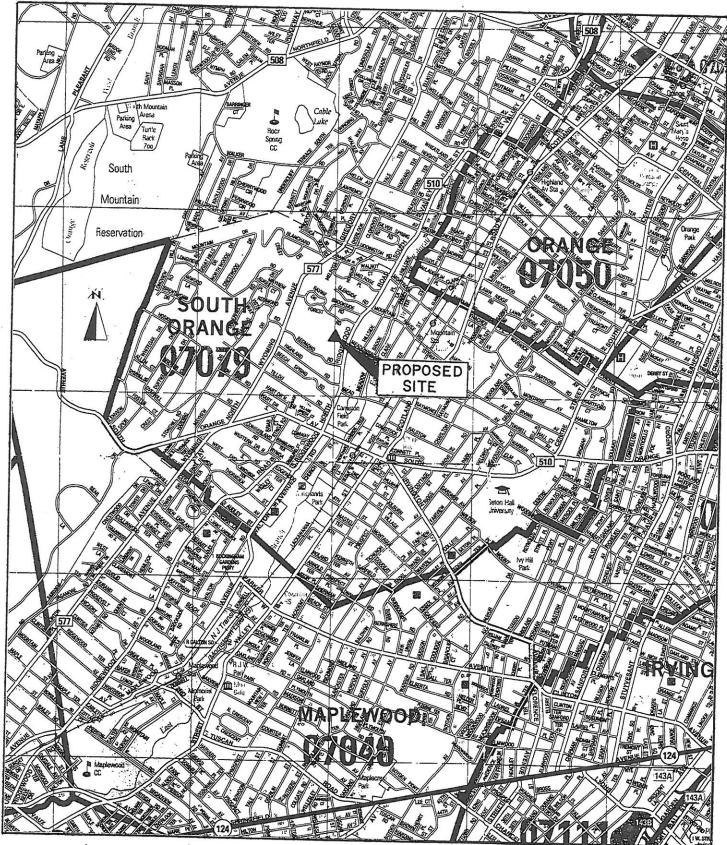

The tennis club facility will continue its current operations, with no changes to events, activities, etc., that would affect site trip generation. As the Club currently uses the area where the townhouse project is to be built for event overflow parking, the site plan also identifies revised paved and overflow parking areas on the remaining Club site, to compensate for this displacement. Primarily due to the foregoing noted parking area changes, the Club is a co-applicant in this project.

In view of the proposed residential development, the Villas has retained the firm of Hamal Associates, Inc. (HMA) to determine the traffic impacts of the proposed residential site development at the intersections of; 1) N. Ridgewood Road & the Club Drive, and 2) Redmond Road & the Club Drive, during the weekday am and pm street peak hours and identify mitigation, if necessary. HMA will also evaluate site access, on-site circulation, parking quantity and dimensions, based on the NJ Residential Site Improvement Standards (RSIS).

This revised traffic study reflects traffic counts performed in September 2016, when schools were in session. The original traffic study (dated August 16, 2016) utilized traffic counts performed during the

summer, when schools were closed. To compensate for lower summer traffic flows, a 10% increase was applied to the 2016 summer peak hour traffic volumes. It is noted that the summer peak hour volumes, with 10% volume increase, were similar in magnitude to the September 2016 peak hour volumes.

The purpose of this report is to present the data gathered, methods of analysis and summarize the subsequent impacts and findings identified.

Hagstom Map Company, Inc., 36-36 33rd Street, Long Island City, New York 11106

# EXHIBIT 1 PROJECT LOCATION MAP

# II. EXISTING CONDITIONS

The townhouse/Club site is located in the north-central area of the Township of South Orange Village, just west of N. Ridgewood Road and between Redwood Road and Forest Road. The Club site's two existing access drives are to remain unchanged. One access drive intersects N. Ridgewood Road, as a T-intersection, approximately 220 feet south of Forest Road. A second access drive intersects Redmond Road, as a T-intersection, approximately 725 feet west of N. Ridgewood Road. The two Club access drives are inter-accessible on-site. Existing development in the area consists of residential properties, with Cameron Field Park and South Orange Middle School located nearby to the south along the east side of N. Ridgewood Road.

Within the study area, N. Ridgewood Road is a north-south municipal roadway having a 28+/- foot wide pavement, with curbing and sidewalks along each side of the road. A posted 25 mph speed limit is in effect. The roadway alignment is generally straight and relatively level. One travel lane is provided in each direction with no parking permitted on either side of the roadway. N. Ridgewood Road extends into the Township of West Orange, to the north, where it changes name to S. Valley Street. To the south, N. Ridgewood Road crosses South Orange Avenue at a signalized intersection, and continues south eventually entering the Township of Maplewood. The Township Master Plan and the NJDOT classify N. Ridgewood Road as an urban minor arterial.

Redmond Road is a short, east-west municipal roadway that extends between 'Stop' controlled intersections at N. Ridgewood Road, to the east, and N. Wyoming Avenue, to the west. A 25 mph speed limit is in effect and curbing and sidewalk are present along each side of the road. Redmond Road traverses a downgrade to the east and has several horizontal curves along its length. Within the vicinity of the Club access drive intersection, Redmond Road is approximately 26 feet wide. Each side of Redmond Road is posted for 2 Hour Parking, 8 AM – 12 PM, Except Weekends and Holidays.

## III. DATA COLLECTION AND EXISTING TRAFFIC

In order to determine the impact of any proposed development upon the identified roadway system, the present day condition must be established. To this end, the site plan and relevant statistics for the proposed project were obtained from the site engineer (Casey & Keller, Inc.) and the Applicant. The yearly background traffic growth rates (1.50%-N. Ridgewood Rd, 1.00% Redmond Rd), for the study area roads, were obtained from the NJDOT. HMA performed field surveys to establish geometrics, lane arrangements/widths, traffic control, parking restrictions/regulations and speed limits. HMA also contacted the Township Planning/Zoning Office to determine if there were any nearby projects proposed/approved that might affect our traffic study area. We were advised by the Township Engineer that there are no 'other' projects that would impact our study area.

Supplementing the above, HMA conducted manual traffic counts (7-9am, 4-6pm) on Thursday – September 15, 2016, and on Saturday – September 10, 2016, at the intersections of N. Ridgewood Road with the Club Drive and Redmond Road with the Club Drive. The traffic counts were performed on a normal business day, the school year was in session, weather was good and all roadways were open. The data was compiled in 15 minute intervals by traffic movement to permit identification of the street peak hours of operation and determination of the peak hour factors required in the analysis of roadway intersection capacity. A tabulation of truck/bus traffic was also kept for use in the capacity analysis. The traffic count data was tabulated onto standard forms and is presented in the Appendix (see A-1 thru 6). The results of these surveys indicated a weekday am peak hour of 7:30-8:30, a pm peak hour of 5:00-6:00 and a Saturday peak hour of 10:45-11:45 am. Exhibit 2 summarizes the existing weekday 2016 peak hour vehicular volumes at the noted intersections.

Exhibit 3 expands the 2016 existing peak hour volumes by the NJDOT annual background traffic growth rates (See A-31) through 2018, which is the anticipated year of completion of the project.

For the peak hours noted, a review of existing traffic volumes indicated the conditions within the study area as follows:

## AM PEAK HOUR (7:30-8:30)

- 1. Two-way traffic flow on N. Ridgewood Road, at the Club Drive intersection, was 623 vehicles with the flow heavier in the southbound travel direction (269 vehs. NB, 354 vehs. SB). Numerous gaps in the traffic flow were observed in each travel direction of N. Ridgewood Road, which resulted in short delays to vehicles entering/exiting the Club Drive. Traffic flow to/from the Club Drive was very low, equaling 1 vehicle inbound and 1 vehicle outbound. This intersection operated in a free flowing manner.
- 2. Two-way traffic on Redmond Road, at the Club Drive intersection, was extremely light equaling only 76 vehicles (44 vehs. EB, 32 vehs. WB). Only 1 vehicle exited the Club Drive, and only 2 vehicles entered this drive. This intersection operated in a free flowing manner.

## PM PEAK HOUR (5:00-6:00)

- 1. Two-way traffic flow on N. Ridgewood Road, at the Club Drive intersection, was 726 vehicles with the flows more heavily oriented northbound (469 vehs. NB, 257 vehs. SB). Numerous gaps in the traffic flow were again observed in each travel direction of N. Ridgewood Road. Traffic flow to/from the Club Drive was very low, with only 5 vehicles outbound and 3 vehicles entering. This intersection operated in a free flowing manner.
- 2. Two-way traffic activity on Redmond Road, at the Club Drive intersection, was again extremely light, equaling only 62 vehicles (40 vehs. EB, 22 vehs. WB). Only 5 vehicles exited the Club Drive, and only 4 vehicles entered this drive, in the entire peak hour. This intersection operated in a free flowing manner.

# SATURDAY PEAK HOUR (10:45-11:45 AM)

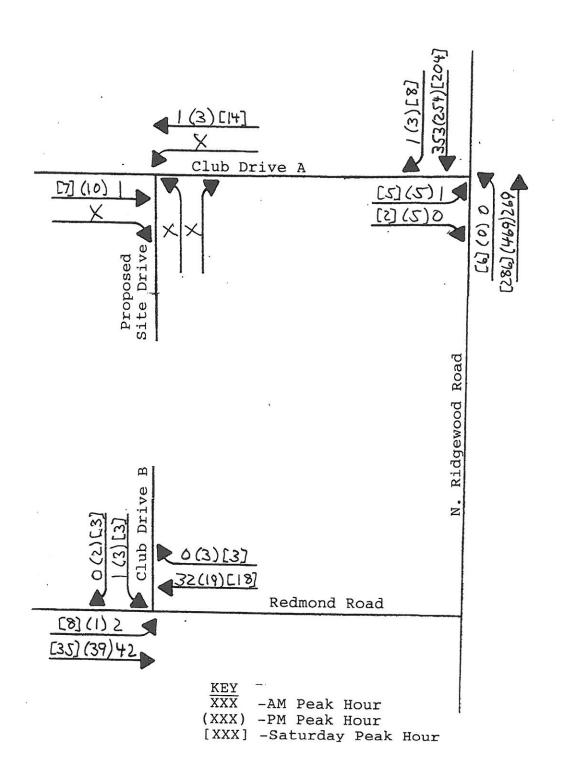

Two-way traffic flow on N. Ridgewood Road, at the Club Drive intersection, was 504 vehicles
with the flows more heavily oriented northbound (292 vehs. NB, 204 vehs. SB). Numerous gaps
in the traffic flow were again observed in each travel direction of N. Ridgewood Road. Traffic

flow to/from the Club Drive was very low, with only 7 vehicles outbound and 14 vehicles entering. This intersection operated in a free flowing manner. Saturday peak hour traffic volumes were lower than either of the weekday peak hours.

2. Two-way traffic activity on Redmond Road, at the Club Drive intersection, was again extremely light, equaling only 64 vehicles (43 vehs. EB, 21 vehs. WB). Only 6 vehicles exited the Club Drive, and only 11 vehicles entered this drive, in the entire peak hour. This intersection operated in a free flowing manner.

# EXHIBIT 3

# 2018 EXISTING PEAK HOUR TRAFFIC VOLUMES WITH BACKGROUND TRAFFIC GROWTH

# IV. TRAFFIC PROJECTIONS AND ASSIGNMENTS

As part of any analysis, site generated traffic must be assigned to the surrounding roadway system. In performing the impact analysis for this project, traffic projections were prepared based on the residential townhouse use proposed for the site. These projected volumes were compiled for the am and pm weekday street peak hours of operation and inbound/outbound traffic patterns. The proposed development is to have a total of 20 townhouse units. The traffic volume projections were based on trip generation rates, for the total number of units, developed by the Institute of Transportation Engineers (ITE) and as published in their text, Trip Generation-9<sup>th</sup> Edition (Land Use Code 230 - Residential Condominium/Townhouse – See Appendix A-7, 8). Table 1 summarizes the very small magnitude of projected trip generation for this site, which is 14 trips in the am peak hour, 16 trips in the pm peak hour and 9 trips in the Saturday peak hour (total two-way). It is noted that the NJ Residential Site Improvement Standards (RSIS) require the use of the ITE Trip Generation publication for calculating peak hour trips for any residential land use.

TABLE 1

20 Units Townhouse	2	12	14	11	5	16	5	4	9	

Having determined the trip generation for the residential townhouse site, the trips developed were assigned to the surrounding roadway system based on existing peak hour travel patterns identified from the field traffic counts, site and area roadway accessibility, and with consideration of the Orange Lawn Redevelopment Plan Ordinance #2016-08.

The Redevelopment Ordinance states (p. 9) that the 20 townhouses "...shall be accessed from Ridgewood Road via the existing Orange Lawn Tennis Club driveway." Based on the preceding, an analysis of N. Ridgewood Road traffic volumes identified peak hour percentile orientations, for the residential site, of 60% to/from the south and 40% to/from the north on N. Ridgewood Road.

Although the Redevelopment Ordinance has all residential site traffic to/from N. Ridgewood Road, the Club's second access drive at Redmond Road affords a more favorable routing for residential generated vehicles destined to/from the southwest of the site, though the South Orange Avenue & N. Wyoming Avenue intersection. This orientation pattern is not only shorter than traveling N. Ridgewood Road to South Orange Avenue, but also avoids the traffic signal at the N. Ridgewood Road & South Orange Avenue intersection. HMA has assumed 20% of the townhouse peak hour trips would use the secondary travel route, which adjusts the peak hour trip assignments at the N. Ridgewood Road & Club Drive intersection to 40% to/from each direction of N. Ridgewood Road. It is noted that the 20% trip assignment to the Club Drive at Redmond Road is nominal in magnitude, equaling only 2-3 trips in either peak hour. Applying the noted orientation percentages to the site peak hour generated traffic resulted in the site trip assignments shown on Exhibit 4.

Exhibit 5 summarizes the 2018 Proposed Full Build peak hour traffic volumes (Exh. 3+4 = Exh. 5).

EXHIBIT 4

SITE GENERATED PEAK HOUR TRIP ASSIGNMENTS

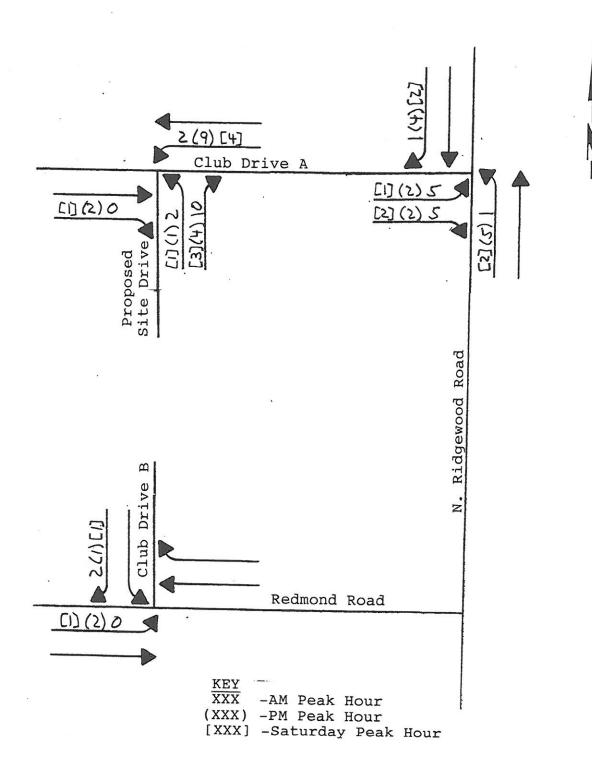

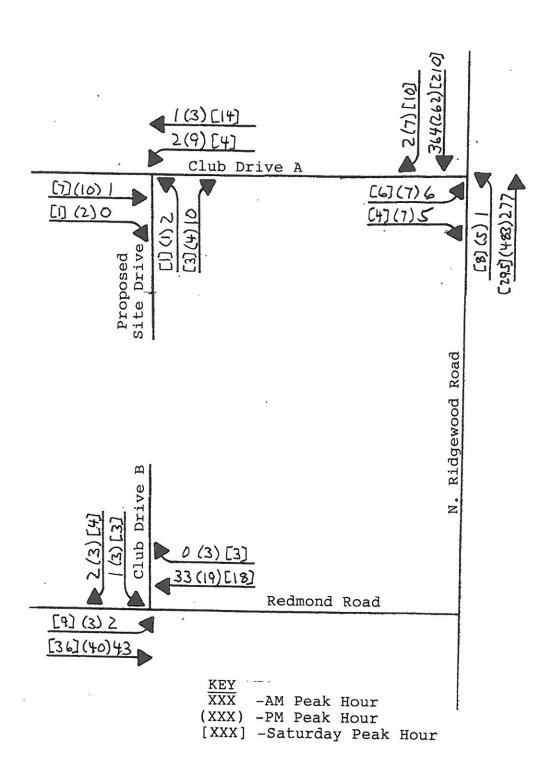

EXHIBIT 5

2018 PROPOSED FULL BUILD PEAK HOUR TRAFFIC VOLUMES

## V. ANALYSIS

Based on the data gathered, traffic projections performed and directional assignments made, the subject intersections of this study were analyzed as to capacity and levels of service (LOS) during the weekday am and pm street peak hours. Capacity analyses were based on unsignalized intersection procedures, as published in the 2010 Highway Capacity Manual (HCM) and associated Highway Capacity Software (HCS). The various time periods and conditions analyzed were as follows:

- 1. 2016 Existing Conditions;
- 2. 2018 Existing No Build Conditions with background traffic growth; and
- 3. 2018 Proposed Full Build Conditions.

The efficiency with which an intersection operates is a function of volume and capacity. The capacity of an intersection is the volume of vehicles it can accommodate during a peak hour and is described in terms of Level of Service (LOS). Levels of Service range from 'A' through 'F', with 'A' representing excellent conditions with little or no delays, while 'F' has long delays and possible flow breakdown. A more in-depth description of Levels of Service for unsignalized intersections can be found in the Appendix to this report (see A-9), as well as the analysis computations (A-10 thru 30). Accordingly, the following findings were established and conclusions drawn relating to traffic capacity impacts to be generated by the proposed residential development.

# A. N. Ridgewood Road & Club Drive

Table 2 summarizes the results of HCM capacity analysis procedures for unsignalized intersections, based on existing geometrics, traffic control, and existing/proposed volumes (see A-10 thru 21). The capacity analyses reflects 20% of the site generated traffic being assigned to/from the Redmond Road Club access drive.

For 2016 existing conditions, and all peak hours, the N. Ridgewood Road NB left turn movement to the Club Drive functions at LOS 'A'. The Club Drive EB approach left/right movements operate at LOS 'B' in all peak hours. All the foregoing are very good peak hour operating conditions, indicative of short delays and short vehicle queues.

With inclusion of background traffic growth to 2018 (existing condition), there were no changes in the LOS 'A' or 'B' identified for the several roadway approaches. Impacts were in the form of a fraction of a second or no increase in delay.

With construction of the residential townhouse project, in the 2018 Full Build scenario, there were again no changes in the levels of service 'A' or 'B' identified for the several roadway approaches in either peak hour. Impacts were in the form of a fraction of a second or no increase in delay. This impact is essentially imperceptible to motorists, with the intersection continuing to operate at very good conditions. No mitigation is required at this intersection due to the proposed project.

If all townhouse generated traffic was restricted to using the Club Drive to/from N. Ridgewood Road only, the 2018 Full Build capacity analyses would remain unchanged at LOS 'A' and 'B' with only a fraction of a second of change in average vehicle delay (see A-19-21). This is reflective of the nominal volumes affected and generated by the townhouse project.

# TABLE 2

# PEAK HOUR CAPACITY ANALYSIS N. RIDGEWOOD ROAD & CLUB DRIVE UNSIGNALIZED

Key: LOS = Level of Se	rvice		

Avg Del = Average Vehicle Delay

# B. Redmond Road & Club Drive

Table 3 summarizes the results of HCM capacity analysis procedures for unsignalized intersections, based on existing geometrics, traffic control, and existing/proposed volumes (see A-22 thru 30). The capacity analyses reflects 20% of the site generated traffic being assigned to/from the Redmond Road Club access drive.

For 2016 existing conditions, and all peak hours, the Redmond Road EB left turn movement to the Club Drive functions at LOS 'A'. The Club Drive SB approach left/right movements operate at LOS 'A' in all peak hours. All the foregoing are very good peak hour operating conditions, indicative of short delays and short vehicle queues.

With inclusion of background traffic growth to 2018 (existing condition), there were no changes in the LOS 'A' identified for the several roadway approaches. There were no identifiable increases in average vehicle delay.

With construction of the residential townhouse project, in the 2018 Full Build scenario, there were again no changes in the LOS 'A' identified for the several roadway approaches in any peak hour. The critical intersection movements will experience no increases in delay, which is due to the nominal increase in site generated traffic through this location and which will be imperceptible to motorists. The intersection will continue to operate at very good conditions. No mitigation is required at this intersection due to the proposed project.

Key: LOS = Level of Service

Avg Del = Average Vehicle Delay

# C. Townhouse Site Circulation & Parking

The proposed townhouse project is located in the eastern section of the Orange Lawn Tennis Club property. Access to the townhouse site is through a cul-de-saced (hammerhead design terminus) roadway that will intersect the Club's existing N. Ridgewood Road access drive, as a 'Stop' controlled T-intersection approach on the latter's south side. As part of this project, some widening of the Club Drive will be performed between the townhouse site drive and N. Ridgewood Road, so as to provide a uniform 20 foot wide pavement. No parking will be permitted on either side of the Club Drive, within the noted length of road. Access to local roads is available for the townhouse site through the Club's access drives to N. Ridgewood Road and Redmond Road.

Being a residential development, the townhouse project is subject to the NJ Residential Site Improvement Standards (RSIS). Based on the RSIS guidelines, we note the following related to parking and traffic volumes:

- a. There are 80 parking spaces provided for the 20 townhouse units. Each townhouse has a two-car garage and driveway combination which counts as 3.5 off-street parking spaces, based on the RSIS Sect. 5:21-4.14(d)3. This equals 70 spaces for the 20 townhouse units. In addition, there are ten (10) on-street parking spaces provided, distributed as five (5) perpendicular spaces by the hammerhead turnaround terminus, and five (5) parallel spaces along the east side of the site access road. The RSIS Table 4.4 Parking Requirements For Residential Land Uses, requires 2.4 spaces per 3 bedroom townhouse, or 48 spaces for the 20 units proposed. The RSIS parking standard is more than adequately met, with 80 spaces provided (4.0 spaces per unit).
- b. The proposed site access road is 28 feet wide and provides 7 foot wide parallel parking spaces, as well as a sidewalk on one side of the road. This conforms with RSIS Table 4.3 Cartway and Right-of-Way Widths and Illustration 1 of 14, for a Residential Access-a. Parallel Parking Low Intensity.

- c. The five on-street, perpendicular parking spaces are 9'x18' in size, which conforms with RSIS Sect. 5:21-4.15. The five on-street parallel parking spaces are 23 feet long, which conforms with RSIS Sect. 5:21-4.14(f).
- d. Based on RSIS Table 4.2, the maximum average daily traffic (ADT) for a multi-family access cul-de-sac that provides a means for vehicles to turn around (hammerhead design), is 1000 trips. For the 20 townhouse units proposed, the ADT is 116 trips, which is well within the RSIS maximum of 1000 ADT limit.
- e. Sect. 5:21-4.14 Table 4.4 Parking Requirements For Residential Land Uses Table 4.4 Note b states: "Requirements for attached units (apartment/condominium/townhouse) include provisions for guest parking (0.5 spaces per dwelling unit). Guest parking must either be provided for on street or in common parking areas."
  - With 20 townhouse units proposed, a total of 10 visitor parking spaces would be required, based on the 0.5 spaces per unit for visitors (included within the 2.4 spaces per unit). As 10 on-street perpendicular/parallel parking spaces are provided, the RSIS guideline is met.
- f. RSIS Sect. 5:21-4.14(d)3. "A two car garage and driveway combination shall count as 3.5 off-street spaces, provided a minimum parking area width of 20 feet is provided for a length of 18 feet, as specified for a one-car garage and driveway combination."
  - The site plan provides 20 foot wide drives that are a minimum of 20 feet long, thereby conforming to the RSIS.

Ingress and egress to and from the site is designed and will function in a safe and efficient manner, in accordance with sound engineering practice and considering reasonable and prudent driving behavior.

# D. Orange Lawn Tennis Club Parking and Improvements Summary

As part of the site plan application, there are several changes being made to the Club's portion of the property, as follows:

- 1. The townhouse development is being constructed in a field area where the Club currently valet parks overflow vehicles for major events. Consequently. This valet parking is being relocated onto the Club's remaining portion of the property. Secondly, Club valet overflow parking along the N. Ridgewood Road access drive will no longer be allowed and is also being relocated onto the Club's remaining property.
- 2. To accommodate the relocated valet overflow parking, the site plan has reconfigured and added some paved parking spaces and identified areas for overflow (valet) parking. A total of 150 parking spaces are provided in this redesign, distributed as 104 paved spaces and 46 overflow spaces. It is noted that the 150 parking spaces exceeds the required minimum of 146 spaces for the Club site, the latter number established in a prior municipal Board application approval.
- 3. Two (2) tennis courts, located in the rear of the Club site, are proposed to have 'bubble domes' placed over them, so as to accommodate winter play. Trip generation related to this proposal is minimal, as it affects only two courts that would allow tennis play during winter months when there is minimal use of the recreational portion of the Club site.

There are no modifications being proposed to the Club's operations, including maximum number of catered events, which are identified and restricted according to the terms of a previous Resolution of the South Orange Planning Board (Case No. 204A – July 17, 2008), related to an addition to the clubhouse ballroom.

# VI. <u>CONCLUSIONS</u>

From the analysis performed and as presented herein, it is the conclusion of this report that the proposed 20 unit residential townhouse project will have no significant or detrimental traffic impacts at either of the Club Drive intersections with N. Ridgewood Road or Redmond Road. The capacity analyses identified very good levels of service, in the LOS 'A' – 'B' range at each intersection in each peak hour studied. Impacts will essentially be imperceptible to motorists. The project's projected weekday peak hour trip generation is very small in magnitude, being only 14 and 16 trips in the respective am and pm peak hours, and 9 trips in the Saturday peak hour.

Being a residential development, the townhouse project is subject to the NJ Residential Site Improvement Standards (RSIS). Based on the RSIS guidelines, the 20 proposed 3 bedroom units require a minimum of 48 parking spaces, with 80 spaces being provided on-site. Seventy (70) of the parking spaces are provided in garages and driveways, with the remaining 10 spaces located on-street as perpendicular (5) and parallel (5) parking spaces. The ten on-street spaces meet the RSIS requirement for ten on-street visitor spaces.

The maximum average daily traffic (ADT) permitted by the RSIS, for a multi-family cul-de-sac that provides a means of turnaround, is 1000 trips. For the 20 townhouse units proposed, the ADT is 116 trips, which is well within the RSIS maximum 1000 ADT limit.

Signage and pavement markings should be provided as noted on the site plans.

As part of the site plan application, there are several changes being made to the Club's portion of the property. The townhouse development is being constructed in a field area where the Club currently valet parks overflow vehicles for major events. Secondly, Club valet overflow parking along the N. Ridgewood Road access drive will no longer be permitted. The noted overflow parking is being relocated onto the Club's remaining property in reconfigured and paved parking areas. The 150 parking spaces provided in the redesign exceed the 146 spaces required for the Club site, the latter number established in a prior municipal Board application approval. Lastly, two (2) tennis courts, located in the rear of the Club site, are proposed to have 'bubble domes' placed over them, so as to accommodate

winter play. Trip generation related to this proposal is minimal, as it affects only two courts that would allow tennis play during winter months when there is minimal use of the recreational portion of the Club site. There are no modifications being proposed to the Club's operations.

Ingress and egress to and from the site is designed and will function in a safe and efficient manner, in accordance with sound engineering practice and considering reasonable and prudent driving behavior.

## LEVEL OF SERVICE ANALYSIS

While traffic volumes provide a measure of activity on the area roadway system, it is also important to evaluate how well that system can accommodate those volumes – i.e., a comparison of peak hour traffic volumes with available roadway capacity. By definition capacity represents the maximum number of vehicles that can be accommodated given the constraints of roadway geometry, environment, traffic characteristics, and controls. Intersections are usually the critical point in any road network since it is at such points that conflicts exist between through, crossing, and turning traffic. It is at these locations where congestion is most likely to occur.

# Unsignalized Intersections

An unsignalized (i.e., "YIELD" or "STOP" sign controlled) driveway or side street along a through route is seldom critical from an overall capacity standpoint, however, it may be of great significance to the capacity of the minor cross-route, and it may influence the quality of traffic flow on both. In analyzing unsignalized intersections, it is assumed that both the through traffic movements and right turn movements on the major street approaches are unimpeded and have the right-of-way over the minor street approaches and left turns from the major street. All other turning movements at the intersection cross, merge with, or are otherwise impeded by the major street movements.

The concept in determining traffic delays at an unsignalized intersection is to process these impeded movements in a sequential manner. For each impeded movement, all conflicting flows are summed, and an initial critical 'gap' in traffic is determined with a "follow-up" gap determined for subsequent vehicles waiting in a queue. Based upon the number of available gaps in the passing traffic stream, the potential capacity of that movement can be calculated.

However, since operation at capacity is usually unsatisfactory to most drivers, a descriptive mechanism (Level of Service) has been developed to describe traffic operations as a function of average total delay. Unsignalized Levels of Service range from 'A' (delays less than seconds) to 'F' (delays greater than seconds). Table I summarizes the relationship between capacity and Level of Service for unsignalized intersections:

TABLE I

Levels of Service and Expected Delay
For Unsignalized Intersections

Level of Service	Average Total Delay (Seconds/Vehic
2	<10
b.	>10 and ≤ 15
c	>15 and <25
d	> 25 and ≤ 35
e	> 35 and < 50
f	. >50

							COUNTY	Atlantic	Bergen	Burlington	Camden	Cape May	Cumperland	Essex	Gloucester	Hudson	Hunterdon	Mercer	Middlesex	Monmouth	Morris	Ocean	Passaic	Salem	Somerset	Sussex	Union	Warren

NOTE: For use in short term (within 1-3 years) background growth ONLY.

Example: Assume existing condition is 1,500 peak hour trips and the applicable growth rate is 2%. The multiplication factor for 2% compounded for 3 years is 1,0612. The three-year peak hour trips. [1592 = 1500(1+0.02)<sup>3</sup> = 1500(1.0612)]

Future Growth (compounded) = Present Growth \* (1+Growth Rate) # of years

intersection is located on a 4 percent upgrade, then the time gap selected for intersection sight distance design for left turns should be increased from 8.0 to 8.8 s, equivalent to an increase of 0.2 s for each percent grade.

The design values for intersection sight distance for passenger cars are shown in Table 9-6. Figure 9-17 includes design values, based on the time gaps for the design vehicles included in Table 9-5.

No adjustment of the recommended sight distance values for the major-road grade is generally needed because both the major- and minor-road vehicle will be on the same grade when departing from the intersection. However, if the minor-road design vehicle is a heavy truck and the intersection is located near a sag vertical curve with grades over 3 percent, then an adjustment to extend the recommended sight distance based on the major-road grade should be considered.

Table 9-6. Design Intersection Sight Distance—Case B1, Left Turn from Stop

Design Speed (km/h)	Stooping Sinks	Distan Passeng		Design	Stopping	Intersection Sight Distance for Passenger Cars			
	Stopping Sight Distance (m)	Calculated (m)	Design (m)	Speed (mph)	Sight Distance (ft)	Calculated (ft)	Design		
20	20	41.7	45	15	80	165.4	(ft)		
30	35	62.6	65	20	115	220.5	170		
40	50	83.4	85	25	155		225		
50	65	104.3	105	30	200	275.6	280		
60	85	125.1	130	35	250	330.8	335		
70	105	146.0	150	40		385.9	390		
80	130	166.8	170	45	305	441.0	445		
90	160	187.7	190		360	496.1	500		
100	185	208.5		50	425	551.3	555		
110	220	229.4	210	55	495	606.4	610		
120	250		230	60	570	661.5	665		
130	285	250.2	255	65	645	716.6	720		
=+		271.1	275	70	730	771.8	775		
_				75	820	826.9	830		
	ection sight distance			80	910	882.0	885		

Note: Intersection sight distance shown is for a stopped passenger car to turn left onto a two-lane highway with no median and grades 3 percent or less. For other conditions, the time gap should be adjusted and the sight distance recalculated.

Sight distance design for left turns at divided-highway intersections should consider multiple design vehicles and median width. If the design vehicle used to determine sight distance for a divided-highway intersection is larger than a passenger car, then sight distance for left turns will need to be checked for that selected design vehicle and for smaller design vehicles as well. If the divided-highway median is wide enough to store the design vehicle with a clearance to the through lanes of approximately 1 m [3 ft] at both ends of the vehicle, no separate analysis for the departure sight triangle for left turns is needed on the minor-road approach for the near roadway to the left. In most cases, the departure sight triangle for right
